DYNAMO

FOR REVIT

DAY 02 | Reading Revit data and simple calculations

01 COUNT ELEMENTS

Categories (Lighting Fixtures) → All Elements of Category → List.Count

02 READ A FAMILY TYPE PARAMETER

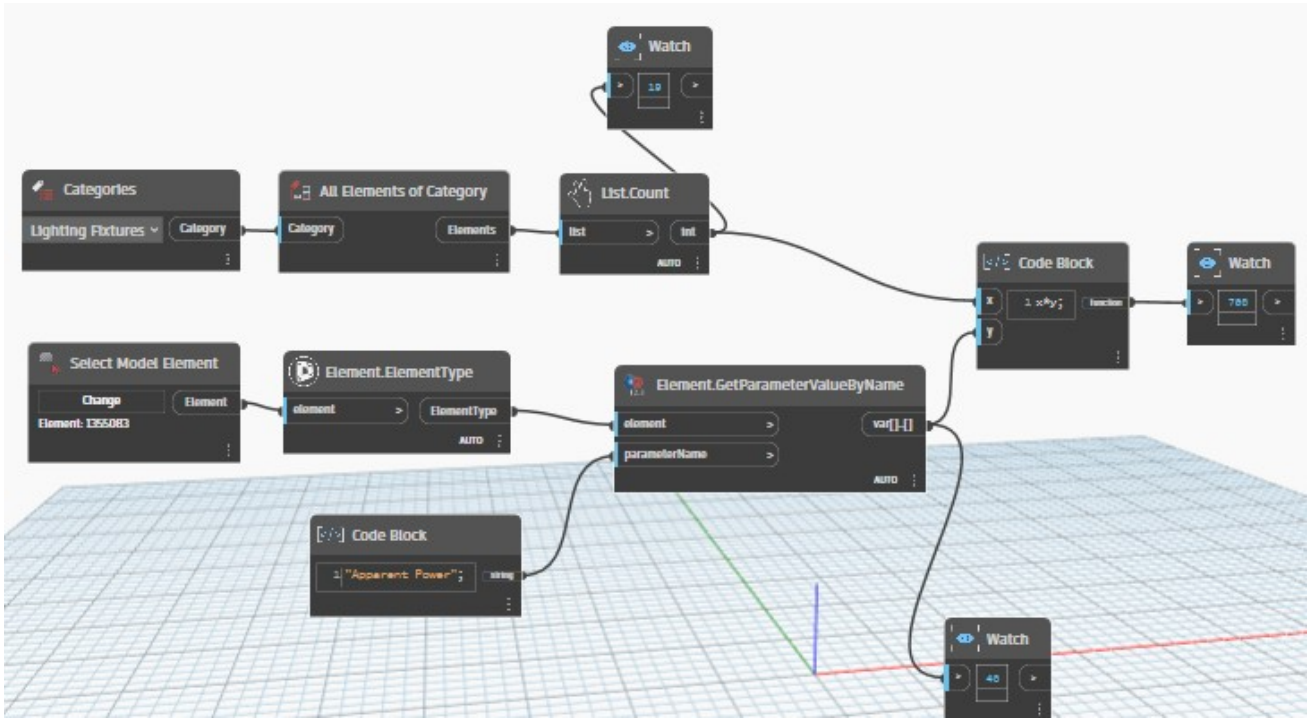

Select Model Element → Element.ElementType → GetParameterValueByName

Code Block: "Apparent Power"; → Watch

03 CALCULATE USING MODEL VALUES

Code Block: x*y; | x = category count | y = selected type parameter

01. Dynamo graph from Revit project

Watch results shown in the graph

18	40	720
Lighting fixture count	Selected type: Apparent Power	Calculated: 18 × 40

Note: 720 is a multiplication result, not a verified total project load. It is valid as a total only if all 18 fixtures have the same 40-unit load.
